

# HARNESSING THE POWER OF DELMIAWORKS ERP FOR UNPARALLELED EFFICIENCY

In the ever-changing landscape of manufacturing, staying ahead of the curve requires cutting-edge solutions that can streamline operations and enhance overall efficiency.

In 2017, we took a significant step by installing Delmiaworks (IQMS) Real-Time ERP, a move that marked the beginning of a transformative journey toward unparalleled operational excellence.

Since then, we have continued to lead the way in Europe as the largest user of Delmiaworks ERP, consistently rolling out upgrades to stay at the forefront of technological innovation.

The adoption of Delmiaworks ERP has brought about a myriad of benefits: Real-time visibility into production processes, enhanced supply chain management, and improved inventory control are just a few of the advantages.

The seamless integration of Delmiaworks has not only optimised internal operations but has also positioned Nordell to respond swiftly to market changes and customer demands.

We recently installed a new, manual production monitoring system into our finishing and assembly operations, providing us with real-time production monitoring in these departments.

We have had real machine cycle time monitoring in our mouldshop since Delmiaworks ERP was installed in 2017; accurate monitoring of our cycle time plays a fundamental role in shaping manufacturing cycles.

By setting the pace of production to match customer demand, we can achieve greater efficiency, reduce lead times, and ultimately deliver products more effectively.

Did you know? Our introduction of Real time monitoring in our assembly and finishing department is a first for any European user of Delmiaworks IQMS.
